

addEventListener vs this keyword

```
<label for="username">Create a username: </label>
<input type="text" id="username" />
<div id="feedback"></div>
```

Which one returns the feedback when the input length is less than 5?

Answer: the first one and the second one.

```
document.querySelector('#username').addEventListener('blur',function(){
    if(this.value.length<5){
        document.getElementById('feedback').innerHTML="must longer than 5"
    }
})
```

```
document.querySelector('#username').addEventListener('blur',function(event){
    if(event.target.value.length<5){
        document.getElementById('feedback').innerHTML="must longer than 5"
    }
})
```

```
document.querySelector('#username').addEventListener('blur',function(event){
    if(event.value.length<5){
        document.getElementById('feedback').innerHTML="must longer than 5"
    }
})
```

Why:

function1 : this keyword---is the target of "blur" event which returns by

:document.querySelector('#username');

Function2: Event target: "#username" element

Function3: Event: blur event;
